

Assignment 1

17

- Due Sept 27, 2019 at 10:00pm
- You are responsible for checking Avenue for news and updates.
- Sample script template to be posted

Keys

18

- A **key** is a set of attributes that uniquely identifies tuples in a relation.
- More precisely:
 - A set of attributes K is a **superkey** for a relation r if r cannot contain two distinct tuples t_1 and t_2 such that $t_1[K] = t_2[K]$;
 - K is a **(candidate) key** for r if K is a minimal superkey (that is, there exists no other superkey K' of r that is contained in K as proper subset, i.e., $K' \subset K$)

Example

19

RegNum	Surname	FirstName	BirthDate	DegreeProg
284328	Smith	Luigi	29/04/59	Computing
296328	Smith	John	29/04/59	Computing
587614	Smith	Lucy	01/05/61	Engineering
934856	Black	Lucy	01/05/61	Fine Art
965536	Black	Lucy	05/03/58	Fine Art

- **RegNum** is a key: i.e., **RegNum** is a superkey and it contains a sole attribute, so it is minimal.
- **{Surname, Firstname, BirthDate}** is another key

Beware!

20

RegNum	Surname	FirstName	BirthDate	DegreeProg
296328	Smith	John	29/04/59	Computing
587614	Smith	Lucy	01/05/61	Engineering
934856	Black	Lucy	01/05/61	Fine Art
965536	Black	Lucy	05/03/58	Engineering

- There is no pair of tuples with the same values on both **Surname** and **DegreeProg**;
i.e., in each program students have different surnames; can we conclude that **Surname** and **DegreeProg** form a key for this relation?
No! There **could be** students with the same surname in the same program

Existence of Keys

21

- Relations are sets; therefore each relation is composed of distinct tuples.
- It follows that the whole set of attributes for a relation defines a **superkey**.
- Therefore **each relation has a key**, which is the set of all its attributes, or a subset thereof.
- The existence of keys guarantees that each piece of data in the database can be accessed,
- Keys are a major feature of the Relational Model and allow us to say that it is "**value-based**".

Keys and Null Values

22

If there are nulls, keys do not work that well:

- They do not guarantee unique identification;
- They do not help in establishing correspondences between data in different relations

RegNum	Surname	FirstName	BirthDate	DegreeProg
NULL	Smith	John	NULL	Computing
587614	Smith	Lucy	01/05/61	Engineering
934856	Black	Lucy	NULL	NULL
NULL	Black	Lucy	05/03/58	Engineering

- Are the third and fourth tuple the same?
- How do we access the first tuple?

Primary Keys

23

- The presence of nulls in keys has to be limited.
- Each relation must have a **primary key** on which nulls are not allowed (in any attribute)
- Notation: the attributes of the primary key are underlined
- References between relations are realized through primary keys

<u>RegNum</u>	Surname	FirstName	BirthDate	DegreeProg
643976	Smith	John	NULL	Computing
587614	Smith	Lucy	01/05/61	Engineering
934856	Black	Lucy	NULL	NULL
735591	Black	Lucy	05/03/58	Engineering

Do we Always Have Primary Keys?

24

- In most cases, we do have reasonable primary keys (e.g., student number, SIN)
- There may be multiple keys, one of which is designated as primary.

Recap

25

- A set of fields is a key for a relation if:
 1. No two distinct tuples can have same values in all key fields, and
 2. This is not true for any subset of the key.
- If #2 false, then a superkey.
- If there's >1 key for a relation, one of the keys is chosen to be the primary key.
- E.g., *sid* is a key for Students. (What about *name*?) The set {*sid*, *gpa*} is a superkey.

Primary and Candidate Keys

26

- Enrolled(*sid*, *cid*, *grade*)
1. "For a given student and course, there is a single grade." vs. Enrolled(*sid*, *cid*, *grade*)
 2. "Students can take only one course, and receive a single grade for that course; further, no two students in a course receive the same grade." Enrolled(*sid*, *cid*, *grade*)
 - key (*cid*, *grade*)
- Be careful to define Integrity Constraints (ICs) correctly at design time.
 - ICS are checked when data is updated.

Foreign Keys

27

- Pieces of data in different relations are correlated by means of values of primary keys.
- Referential integrity constraints are imposed in order to guarantee that the values refer to existing tuples in the referenced relation.
- A foreign key requires that the values on a set X of attributes of a relation R_1 must appear as values for the primary key of another relation R_2 .
 - In other words, set of attributes in one relation that is used to 'refer' to a tuple in another relation. (Must correspond to primary key of the second relation.) Like a 'logical pointer'.

Referential Integrity

28

- E.g. *sid* is a foreign key referring to **Students**:
 - Enrolled(*sid*: string, *cid*: string, *grade*: string)
 - If all foreign key constraints are enforced, referential integrity is achieved, i.e., no dangling references.

Referential Integrity (cont'd)

29

- Only students listed in the Students relation should be allowed to enroll for courses.

Enrolled

sid	cid	grade
53666	Carnatic101	C
53666	Reggae203	B
53650	Topology112	A
53666	History105	B

Students

sid	name	login	age	gpa
53666	Jones	jones@cs	18	3.4
53688	Smith	smith@eecs	18	3.2
53650	Smith	smith@math	19	3.8

Enforcing Referential Integrity

30

- Consider Students and Enrolled; *sid* in Enrolled is a foreign key that references Students.
- What should be done if an Enrolled tuple with a non-existent student *id* is inserted? Reject it!
- What should be done if a Students tuple is deleted?
 - Also delete all Enrolled tuples that refer to it.
 - Disallow deletion of a Students tuple that is referred to.
 - Set *sid* in Enrolled tuples that refer to it to a *default sid*.
 - Set *sid* in Enrolled tuples that refer to it to NULL.
- Similar if primary key of Students tuple is updated.

Where do ICs Come From?

31

- ICs are based upon the semantics of the real-world enterprise that is being described in the database relations.
- We can check a database instance to see if an IC is violated, but we cannot infer that an IC is true by looking at an instance.
 - An IC is a statement about *all possible* instances
- Key and foreign key ICs are the most common; more general ICs supported too.

One More Example

32

Offences	Code	Date	Officer	Dept	Registration
	143256	25/10/1992	567	75	5694 FR
	987554	26/10/1992	456	75	5694 FR
	987557	26/10/1992	456	75	6544 XY
	630876	15/10/1992	456	47	6544 XY
	539856	12/10/1992	567	47	6544 XY

Officers	RegNum	Surname	FirstName
	567	Brun	Jean
	456	Larue	Henri
	638	Larue	Jacques

Cars	Registration	Dept	Owner
	6544 XY	75	Cordon Edouard
	7122 HT	75	Cordon Edouard
	5694 FR	75	Latour Hortense
	6544 XY	47	Mimault Bernard

- Offences[Officer] \subseteq Officers[RegNum]
- Offences[Registration,Dept] \subseteq Cars[Registration,Dept]

Violation of Foreign keys

33

Offences	<u>Code</u>	<u>Date</u>	<u>Officer</u>	<u>Dept</u>	<u>Registration</u>
	987554	26/10/1992	456	75	5694 FR
	630876	15/10/1992	456	47	6544 XY

Officers	<u>RegNum</u>	<u>Surname</u>	<u>FirstName</u>
	567	Brun	Jean
	638	Larue	Jacques

Cars	<u>Registration</u>	<u>Dept</u>	<u>Owner</u>	...
	7122 HT	75	Cordon Edouard	...
	5694 FR	93	Latour Hortense	...
	6544 XY	47	Mimault Bernard	...

Referential Constraints: Comments

34

- Referential constraints play an important role in making the relational model value-based.
- Care is needed in case of referential constraints that involve two or more attributes.

Example

35

Accidents	<u>Code</u>	<u>Dept1</u>	<u>Registration1</u>	<u>Dept2</u>	<u>Registration2</u>
	6207	75	6544 XY	93	9775 GF
	6974	93	5694 FR	93	9775 GF

Cars	<u>Registration</u>	<u>Dept</u>	<u>Owner</u>	...
	7122 HT	75	Cordon Edouard	...
	5694 FR	93	Latour Hortense	...
	9775 GF	93	LeBlanc Pierre	...
	6544 XY	75	Mimault Bernard	...

Here we have two referential constraints for **Accidents**:

Registration1, Dept1 to **Cars**

Registration2, Dept2 to **Cars**.
